

MICROLON

AWARD WINNING METAL TREATMENT TECHNOLOGY

Microlon Automatic Transmission Treatment

Treatment Instructions:

1. Shake can vigorously for 30 seconds.
2. Pour entire contents into automatic transmission filler opening.
3. Immediately drive vehicle for at least 100 miles to circulate product and form Microlon film.

How it works:

Microlon Automatic Transmission Treatment is a specially formulated metal treatment for automatic transmissions. It reduces performance-robbing and wear-causing friction on the metal surfaces in your transmission without affecting the fibrous surfaces where friction is required for proper operation. Microlon contains the highest quality cleaning agents, corrosion inhibitors and antioxidants. Microlon cleans the microscopic metal pores and imperfections of varnish and other deposits. Then it impregnates and coats the metal surfaces with a durable micro-thin dry super-lubricant film for reduced metal-to-metal friction and noticeably smoother operation. It also protects against corrosion and scale. You only need to treat your transmission once to reduce maintenance and extend the life of your transmission.
