AWARD WINNING METAL TREATMENT TECHNOLOGY

## Microlon Manual Transmission Treatment Sheet

### Treatment Instructions:

Read through entire instruction sheet before applying product. If you have any questions regarding application, please contact your local dealer or (586) 803-9393.

1. Shake can vigorously for at least 2 minutes or until the white resin material found on the bottom of the container is properly mixed.
2. Add 4 oz to manual transmission.
3. Add 4 oz to differentials.
4. Immediately drive vehicle for at least 100 miles to circulate product to all critical parts and to form Microlon film.

### How it works:

Microlon Compound 90 is a specially formulated metal treatment for manual transmissions and differentials. It reduces performance-robbing and wear-causing friction on gears and other metal surfaces. Compound 90 treats the metal surfaces with durable micro-thin dry super-lubricate film for reduced friction and noticeably smoother operation. It also protects against corrosion and scale. You only need to treat your manual transmission or differential once to reduce maintenance and extend their life.
